🐦 [.\\_andrew\\_leach](https://twitter.com/_andrew_leach)

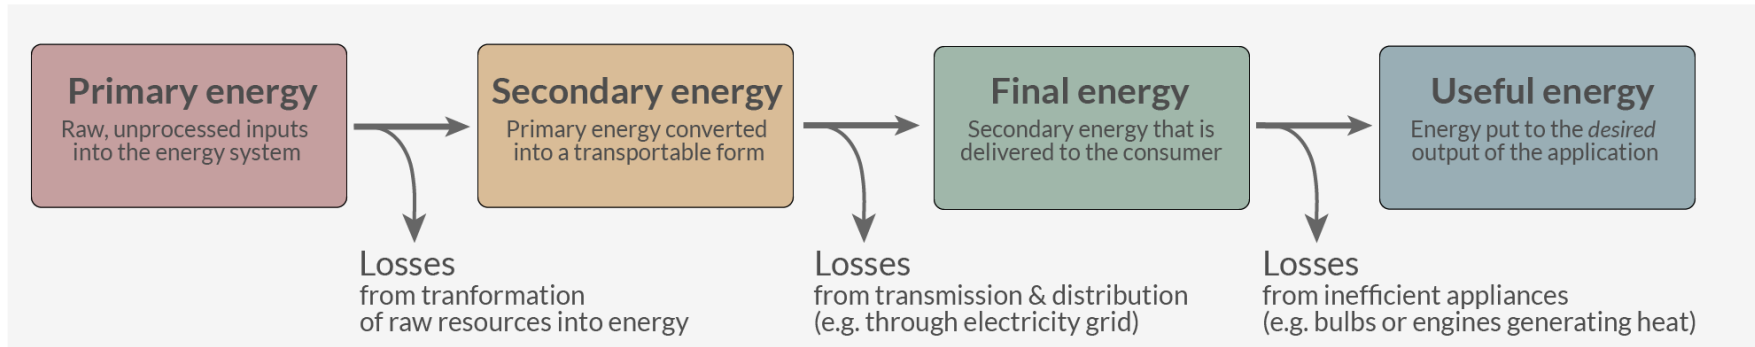

# Forms of energy

- Potential: Stored energy
- Kinetic: Energy of motion
- Chemical: Energy stored in the bonds of atoms and molecules
- Nuclear: Energy stored in the nucleus of an atom
- Gravitational: Energy stored in an object's height
- Radiant: Electromagnetic energy travels in transverse waves
- Thermal: Vibration and movement of atoms and molecules within substances
- Electrical: Delivered by charged particles called electrons, typically moving through a wire

# Energy Classification

## The four ways of measuring energy

Our World  
in Data

Example: Coal to power a lightbulb

Example: Wood to provide heat

Example: Oil to drive a car

Icon source: Noun Project.

# Energy Classification Definitions

*Primary energy* is the energy as it is available as resources: coal, uranium, oil, gas, etc.

*Secondary energy* is converted into a transportable form, e.g. electricity, gasoline and diesel, or heat.

*Final energy* is delivered secondary energy: gasoline at the fuel pump, electricity in your home.

*Useful energy* is the energy that goes towards the desired output as opposed to waste energy. For example, when you run in internal combustion gasoline engine, some energy is lost as heat.

Based on this [post from Hannah Ritchie](#)

# Energy Classification

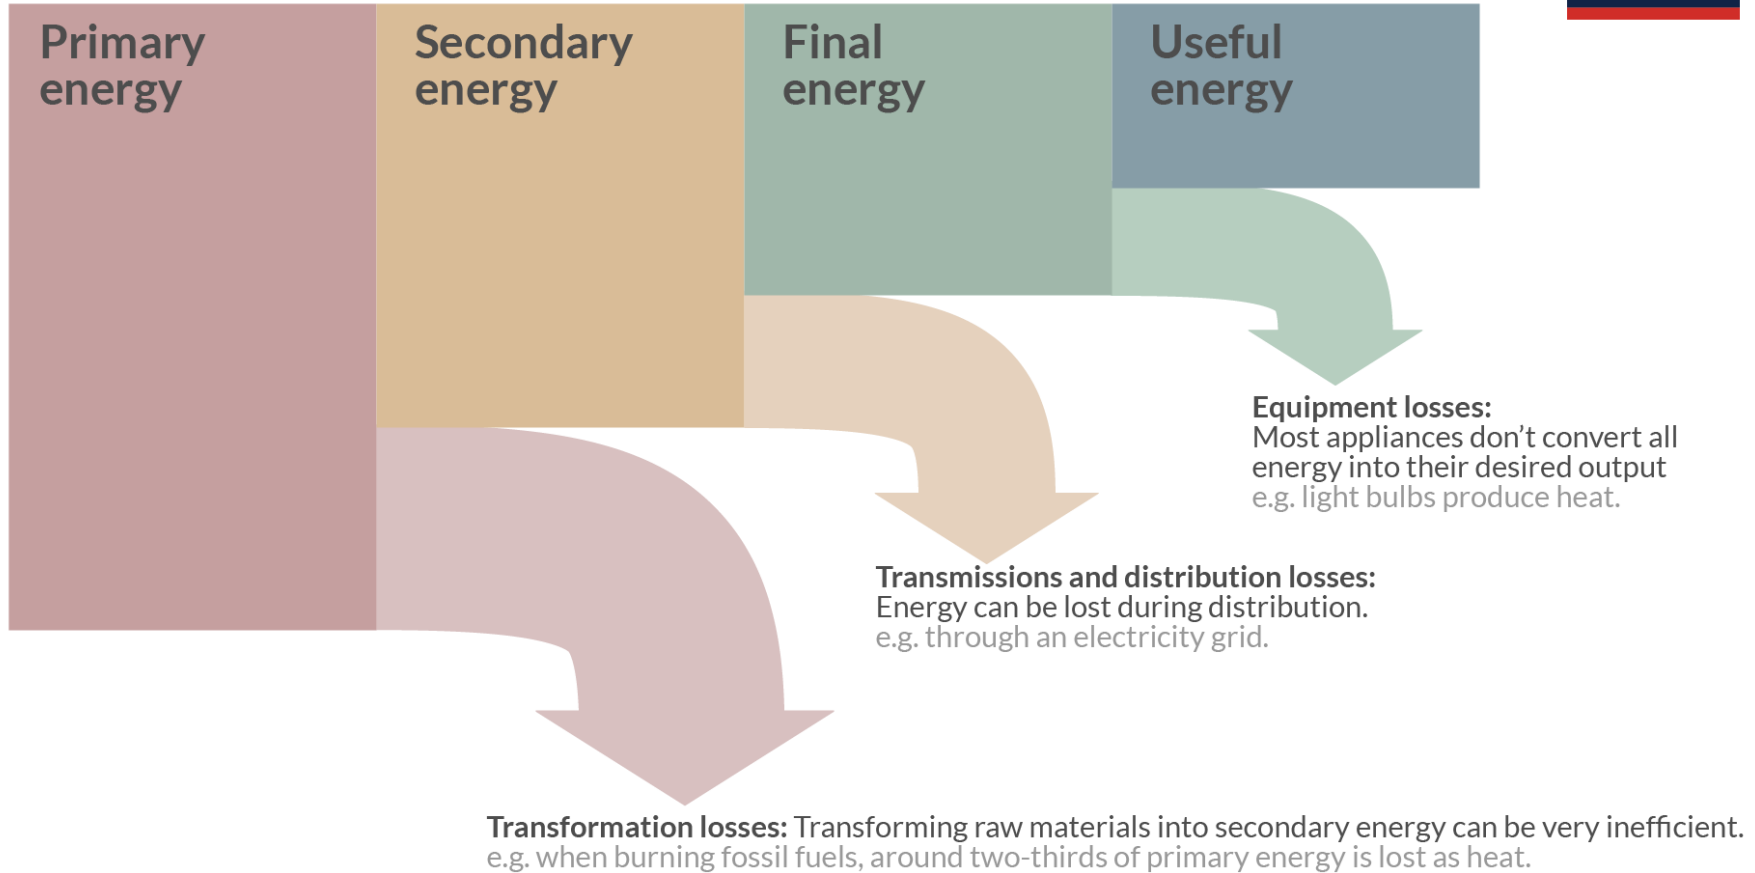

- Primary vs. Secondary vs. Final vs. Useful Energy
  - See [post from Hannah Ritchie](#) mentioned above
- Renewable and Non-Renewable Energy

Renewable energy is energy derived from natural processes that are replenished at a rate that is equal to or faster than the rate at which they are consumed, e.g. energy generated from solar, wind, geothermal, hydropower and ocean resources.

- *Clean vs Dirty* Energy
  - *Clean* energy is a broader category, e.g. may include nuclear, waste heat capture, etc.
- Commercial and Non-Commercial
- Conventional and Non-Conventional
  - *Conventional* tends to be a moving target

# Energy Losses

Useful energy is just a fraction of primary energy

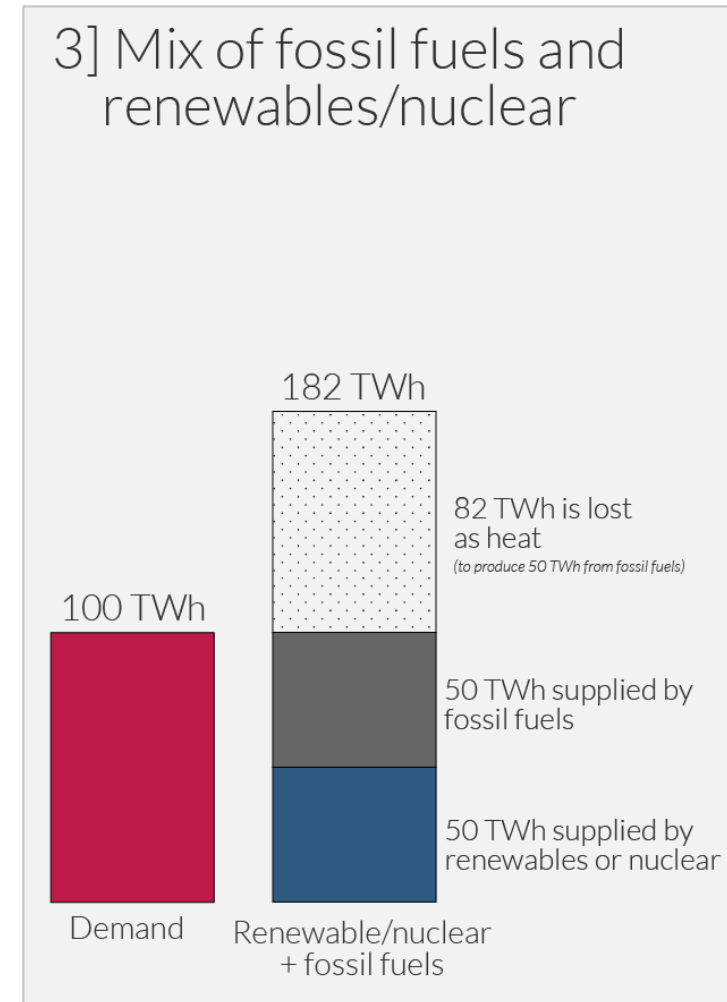

# Calculating Energy Shares

- Direct vs. Substitution Methods for calculating shares of primary energy
  - See [yet another post from Hannah Ritchie](#)
- *direct* calculations look at the energy supplied via, for example, oil and natural gas, but does not take account of the energy lost in conversion processes.
- *substitution* method essentially omits the energy wasted in creating that eventual, useful energy that was consumed

# Energy Shares

Three scenarios of energy input to supply 100 terawatt-hours (TWh)

Our World in Data

# Energy Shares

## Global primary energy by source: direct vs. substitution

\*Includes geothermal, biomass, wave and tidal. It does not include traditional biomass which can be a key energy source in lower income settings.

# Energy Shares

## Share of direct primary energy consumption by source, World

Our World in Data

Measured as a percentage of direct primary energy. This means that fossil fuels include the energy lost due to inefficiencies in energy production.

Data source: Energy Institute - Statistical Review of World Energy (2023) - [Learn more about this data](#)

Note: Other renewables include bioenergy, geothermal, wave, and tidal, but not traditional biofuels.

# Calculating Energy Shares

From [Hannah Ritchie's post](#):

- Low-carbon's share in direct primary energy = % of total primary energy consumption (including all of the inefficiencies of fossil fuel production)
- Low carbon's share in substituted primary energy = % of useful energy (once we subtract all of the wasted energy in the burning of fossil fuels)

# Renewable Energy Generation

## Share of primary energy from renewable sources, 2022

Our World in Data

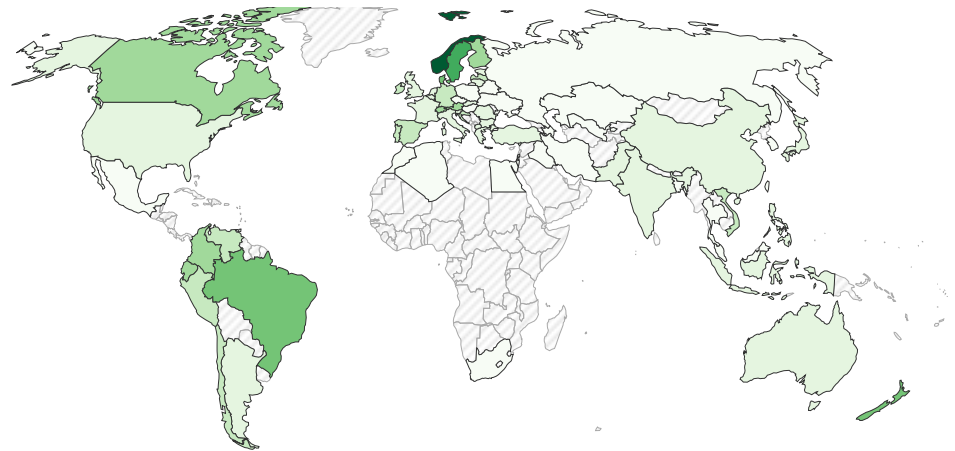

Measured as a percentage of primary energy using the substitution method. Renewables include hydropower, solar, wind, geothermal, bioenergy, wave, and tidal, but not traditional biofuels, which can be a key energy source, especially in lower-income settings.

# Renewable Energy Generation is Growing Fast

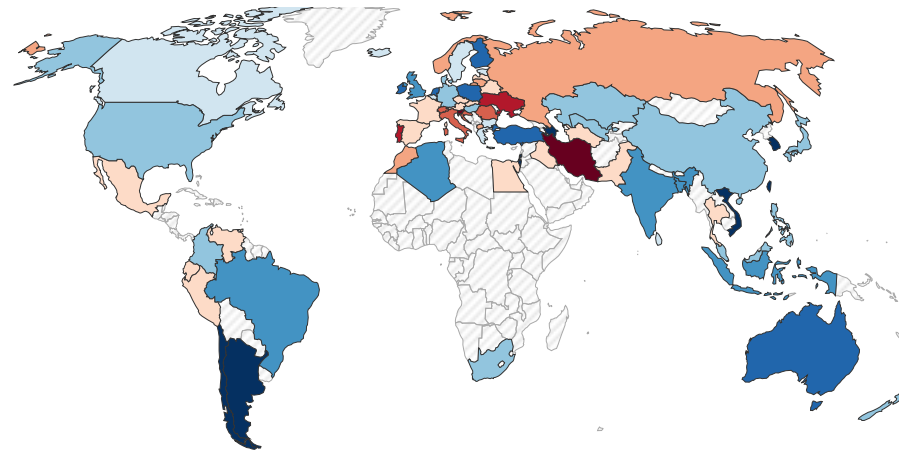

## Annual percentage change in renewable energy generation, 2022

Percentage change in renewable energy generation relative to the previous year. It includes energy from hydropower, solar, wind, geothermal, wave and tidal, and bioenergy.

# Clean vs. Dirty Energy

## U.S. primary energy consumption by energy source, 2022

total = 100.41 quadrillion  
British thermal units (Btu)

total = 13.18 quadrillion Btu

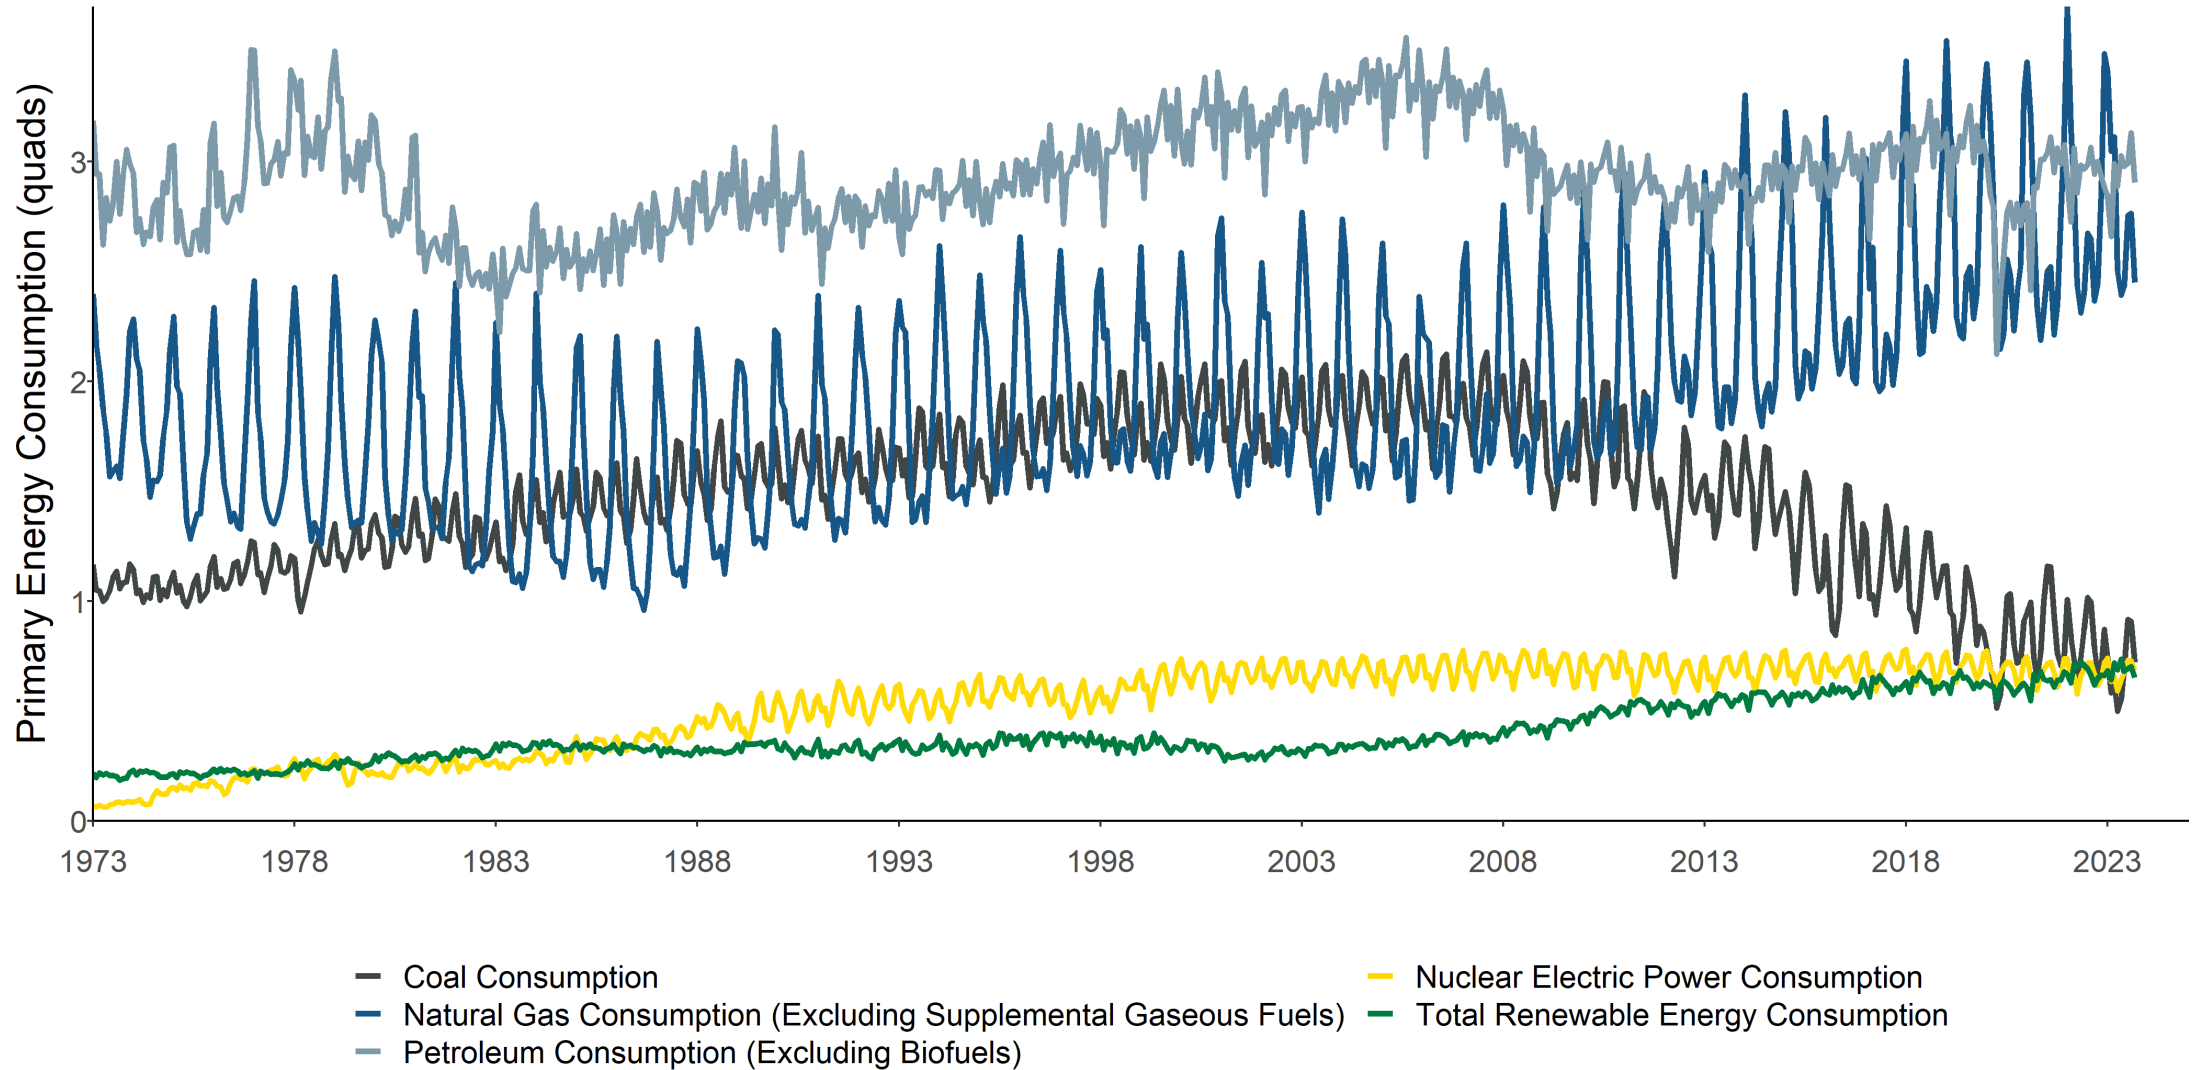

Data source: U.S. Energy Information Administration, *Monthly Energy Review*, Table 1.3 and 10.1, April 2023, preliminary data

Note: Sum of components may not equal 100% because of independent rounding.

This will be the first and (I hope) last pie chart we use in this class

# US Primary Energy

# Canadian Primary Energy Production

Canadian Primary Energy Production

# Measurement Classifications

- Volume or mass units: gallons, liters, barrels, cubic meters, tons, tonnes, cords
- Energy value: Calories, Joules, Watts, British thermal unit (BTU), barrel or tonne of oil equivalent (boe or toe)
- Market value: \$, €, £, etc.

"Wherever mechanical force is expended, an exact equivalent of heat is always obtained"

- James Prescott Joule, 1843

# Richard Feynman on units of energy

# Units

- Newton (N) =  $kg \cdot \frac{m}{s^2}$
- Joule (J) =  $1 \text{ N} \cdot \text{m} = kg \frac{m^2}{s^2} = \text{Watt} \cdot \text{Second}$ 
  - J = Watt · s.
- What is a Watt?
  - Hint: Watt=Work/time
- How many J's do average Albertans use annually?
  - 130,000,000,000 J
- Perhaps, we should choose a different unit?
  - 130,000,000,000 J = 130 GJ
- What about for all Albertans?
  - Scale up to a petajoule, PJ, or  $10^{15}$  Joules

# Units

Where might you run into some of these units?

- check you phone/laptop charger (Apple 29W charger, for e.g.)
- check your breaker panel at home - you'll see breakers in amps (15A, 20A, 30A, 40A and maybe 100A breakers)
  - Household circuits are 120 volts or 240 volts (think *pressure* of the electricity)
  - Amps multiplied by volts equals watts, so a 15A breaker at 120 volts (usual room outlets) have a capacity of  $15 \times 120 = 1,800\text{W}$ .
- check your hairdryer (1500W?)

# How much energy do appliances use?

Appliance	Wattage	Hours Per Month	Monthly Consumption (kWh)	\$/Month (\$0.1524/kWh)
Block Heater	500	120-480	240	\$36.58
Clothes Dryer	5000	6-28	140	\$21.34
Clothes Washer	500	7-40	20	\$3.05
Dishwasher	1300	8-40	52	\$7.92
Hair Dryer	1000	1-10	10	\$1.52
Kettle	1500	1-10	10	\$1.52
Range - Oven	12,500	10-50	625	\$95.25
Refrigerator	500	150-300	150	\$22.86

# Units

Where might you run into some of these units?

- check you phone/laptop charger (Apple 29W charger, for e.g.)
- check your breaker panel at home - you'll see breakers in amps (15A, 20A, 30A, 40A and maybe 100A breakers)
  - Household circuits are 120 volts or 240 volts (think *pressure* of the electricity)
  - Amps multiplied by volts equals watts, so a 15A breaker at 120 volts (usual room outlets) have a capacity of  $15 \times 120 = 1,800\text{W}$ .
- why are you likely to blow a breaker if you run the toaster and the kettle at the same time?

# Units in practice

# Mechanical energy measurements: kWh

- Typically, electricity is billed per kWh
- What is the relationship between kWh and Joules?
  - $1 \text{ kW} = 1 \text{ kJ/s}$  (a flow)
  - $1 \text{ kWh} = 1 \frac{\text{kJ}}{\text{s}} \times \frac{3600\text{s}}{\text{hour}} = 3600\text{kJ}$
- How many kWh's do average Albertans use annually?
  - Albertan households use 124.6 GJ of energy per year
  - $124,600 \text{ MJ} \times \frac{1\text{kWh}}{3.6\text{MJ}} \approx 34,600 \text{ kWh}$

# Thermal energy: Btus and Calories

- Calorie = energy needed to cool or heat one gram of water by one degree C.
- British thermal unit (Btu): amount of energy needed to cool or heat one pound of water by one degree F.
- Question: What does mBtu mean? mmBtu?
- Various conversions:
  - $1 \text{ Btu} \approx 252.164401 \text{ cal}$
  - $1 \text{ Btu} \approx 0.947817 \text{ kJ}$

- Common usage - a 24,000 Btu air conditioner means what, exactly?

[More Options](#)

**Amana** 24,000 BTU 230V Window AC w/ Remote for Rooms up to 1500 sq.ft 24-Hour Timer 3-Speed Auto-Restart Digital Display White

Model# AMAP242BW

★★★★☆ (358)

**\$859**<sup>99</sup>

- Sized by how many Btu of heat it can remove in one hour

# Commercial measures: toe and tce

- toe (tonne of oil equivalent) is the amount of energy released by burning one tonne (metric ton) of crude oil
  - 1 toe  $\approx$  7.25 barrel of oil equivalent
  - 1 toe = 41.87 gigajoules (GJ)
  - 1 toe = 39,683,205 Btu (39.7 mmBtu)
- Converting the other way:
  - One tonne of gasoline is 1.070 toe
  - One tonne of diesel oil is 1.035 toe
  - One tonne of Liquefied petroleum gas (propane) is 1.130 toe
- 1 ton of coal equivalent = 1 tce = 29.3076 GJ

# Conversion Factor Reference
